Environmental Stewardship

Berco has been working towards waste reduction, recycling and conservation for many years. Yet we realize that becoming a "Green" company is a continuous process. We are committed to discovering new materials and processes and implementing them into the production of our products. Environmental Stewardship is an important initiative and a dedicated commitment at Berco.

Using "Green" products made from sustainable materials by environmentally responsible companies is becoming increasingly critical. Architects, municipalities, schools, businesses and institutions see the importance of sustainable design and the essence of the "Green" movement. Many of their projects are specified specifically to be as "Green" as possible and made from sustainable materials.

Berco is currently exploring the wealth of uses for Linoleum (a product that contains renewable raw materials that are both bio-degradable and 100 percent recyclable) as well as other eco-friendly products such as veneers, long recognized as the best utilization of the forest.

We recycle all waste aluminum, steel cuttings and waste paper products. We reuse all tie rod and tubing containers as well as table core cutoffs. Powder coating eliminates the hazards of wet painting. We reclaim powder coating overspray and use it to coat under-table hardware. Plus we use paper packing materials that are manufactured using recycled products and are recyclable themselves.

At Berco, our commitment is to think "Green"
